

Rules for the use of the data on gas quality and calorific values for the calculation of the energy of delivered gas

Rules for the use of the data on gas quality and calorific values for the calculation of the energy of delivered gas at the transmission system exits have been determined by the applicable Transmission System Network Code and Amendments to the Transmission System Network Code ("Official gazette" nos. 50/18, 31/19, 89/19, 36/20 i 106/21, hereinafter MPTS).

By this document the data are publicly announced in compliance with article 106 of MPTS stipulating that the transmission system operator publishes on its website, and regularly updates the following contents concerning the use of the data on gas quality:

- a) list of all sampling locations
- b) list of all connections with associated primary and replacement relevant sampling locations
- c) rules for the use of data on gas quality and calorific values for the calculation of the energy of delivered gas, determined at sampling locations.

a) A list of all gas sampling locations on the transmission system, art. 106 (5) a) MPTS

A list of all gas sampling locations on the transmission system is in Table 1.

The table contains all sampling locations on the transmission system equipped with process gas chromatographs, regardless of whether the device belongs to the transmission system operator or the owner of the connected plant, and 3 locations on which, due to their low capacity, samples are occasionally taken manually and gas analysis is carried out in an accredited laboratory.

One chromatograph installed at one location can have several sampling locations. Sampling location code consists of location (plant) number at which the chromatograph has been installed and the sample number on the same chromatograph separated by dash. In a similar way the name of the sampling location consists of the name of the location (plant) at which a chromatograph is installed and the name of the pipeline direction on which the device for automatic sampling is installed.

Table 1 – A list of all sampling locations on the transmission system

Sampling location code	Sampling location name	Sampling location type	Operator
001-1	MRS/PČ Ivanja Reka - MRS Ivanić Grad (stream 1)	Chromatograph	Plinacro
001-2	MRS/PČ Ivanja Reka - MRS Zagreb-Istok (stream 2)	Chromatograph	Plinacro

18	Virje	Manual sampling	Laboratory

b) A list of all connections with associated primary and replacement relevant sampling locations

A list of all exit connections of the transmission system is indicated in Table 2.

The enclosed table lists separately exits towards distribution systems and exits towards final customers connected directly to the transmission system. In the first part of the table with exits towards distribution systems joint exits to which sampling locations are not associated are marked by yellow background (MPTS, art. 32), while physical exits included in a separate joint exit are marked by green background in the table. For them, the codes of the associated sampling locations are also indicated.

Table 2 - List of all connections with associated primary and replacement relevant sampling locations, art. 106 (5) b) MPTS

No.	Exit code	Exit name	Sampling location name (tablica 1)

c) Rules for the use of the data on gas quality and calorific values for the calculation of the energy of delivered gas

The result of the process chromatograph operation are the data on chemical composition of gas and physical properties calculated from chemical composition of gas whereas the determining of chemical composition of natural gas is carried out in compliance with "HRN EN ISO 6974 – Natural gas – Determination of composition and associated uncertainty by gas chromatography" standard. Pursuant to the Network Code of the Transmission System, standard reference conditions for all metering and calculations of natural gas volume and energy are as follows: - for calculating the volume it is the temperature of 288.15 K (15°C) and pressure of 101.325 kPa (1.01325 bar(a)) – for calculating the calorific value, energy and Wobbe index it is the referent temperature of combustion of 288.15 K (15°C). Conversion of values to other reference conditions is carried out with conversion factors in compliance with "HRN EN ISO 13443 – Natural gas – Standard reference conditions" standard.

The calculation of delivered gas energy at the exit transmission system connections is carried out automatically in the SUKAP information system by multiplying the value of hourly measured gas volume by the average daily net calorific value for the appropriate gas day, for the appropriate sampling location. Hourly measured volume is in this case expressed in a measuring unit of standard cubic meter (Sm³) at a standard pressure (1.01325 bar (a)) and temperature of (15°C) rounded to an integer.

Net calorific value is expressed in kWh/m³, also at the same standard conditions for volume and for temperature of products of combustion of 15°C, rounded to 3 decimal places. The result of multiplying is a quantity of energy for the observed hour expressed in kWh, rounded to an integer without decimal places.

Average daily net calorific value for the sampling location for a gas day is the arithmetic mean value of the results of analyses of all individual gas samplings within the observed gas day.

For an individual connection with gas volume measuring, a relevant sampling location is a sampling location physically placed on the transmission system closest to the observed connection and the sample is taken from the same gas stream without mixing with gases from other sources.

In case of unavailability of data from an individual device, that is, a malfunction of a device, and in case of significant changes in the regime of gas flows through gas pipelines, the transmission system operator may temporarily or permanently assign another, replacement sample, to a gas volume exit metering point. The replacement sample is a sample that meets the same conditions as the primary one (the sample is taken from the same gas stream) but its distance from the connection is larger than the one of the primary relevant sample. In cases when not even the data from the replacement sample are available for use, the last valid data from the relevant sample will be used.

Note:

By introducing daily calorific values for calculations at the transmission system-level, the current practice of half-monthly manual sampling and gas analysing in an accredited laboratory has been abandoned so half-monthly reports on laboratory gas quality analyses are no longer available.

The data on the gas composition at all sampling locations are available on the web page of the transmission system operator in tabular form.

Moreover, calculated weighted net calorific values for exits from the transmission system towards distribution systems for half-monthly and monthly billing periods are published on the web page.
